Principali risultati scientifici

La “Amati relation”

Lo studio dei GRB di BeppoSAX con redshift noto, da me coordinato nel periodo 2000-2002, ha portato alla scoperta di una correlazione tra l'energia totale irradiata assumendo emissione isotropa (E_{iso}) e l'energia di picco dello spettro νF_{ν} ($E_{p,i}$) (Amati et al., A&A, 2002). Questa correlazione, successivamente confermata ed estesa prima ai GRB X-ray rich e agli XRF dalle misure di HETE-2 (Amati, MNRAS, 2006) e successivamente ai GRB ultra-energetici da Fermi (Amati et al., A&A, 2009), viene comunemente citata in letteratura come “Amati relation”. **L'esistenza e l'estensione su diversi ordini di grandezza sia in E_{iso} che in $E_{p,i}$ di questa correlazione hanno importanza fondamentale per i modelli della fisica e geometria dell'emissione dei GRB, l'individuazione e la comprensione di sottoclassi di GRB (Short/long, XRFs, GRB subenergetici), la connessione tra GRB e SN (es., Amati et al. A&A, 2007), l'utilizzo dei GRB per la cosmologia (Amati et al., MNRAS, 2008).**

L'impatto scientifico di questa scoperta è comprovato dall'analisi della letteratura scientifica (al 29 Settembre 2023, da NASA ADS):

- gli articoli Amati et al., A&A, 390, 81 (2002) e Amati, MNRAS, 372, 233, **sono stati citati 1089 e 391 volte**, rispettivamente; il primo è il più citato tra tutti gli articoli che presentano risultati di BeppoSAX.
- in totale, i principali lavori su rivista internazionale con Referee relativi alla correlazione e da me coordinati (oltre ai due precedenti, anche Amati et al. 2007, A&A, 463, 913 ; Amati et al. 2008, MNRAS, 391, 577 e Amati et al. 2009, A&A, 508, 173) **sono stati citati circa 2000 volte.**
- **Il mio nome (Amati) compare nel titolo di 48 articoli / comunicazioni** (di cui 29 articoli su rivista internazionale con Referee) **e nell'abstract di 326 articoli / comunicazioni** (di cui 184 articoli su riviste internazionali con Referee).

Il concetto di missione THESEUS per ESA (M5 e M7)

Il sottoscritto ritiene un risultato e riconoscimento importantissimo della propria esperienza scientifica essere stato proposto dalla fortissima comunità europea sui Gamma-Ray Burst e l'astrofisica multi-messenger come Lead Proposer della proposta THESEUS (Transient High Energy Sources and Early Universe Surveyor) selezionata dall'Agenzia Spaziale Europea (ESA) per uno studio di Fase A (2018-2021) come candidata missione M5 e attualmente (da Novembre 2022) in studio di Fase-0 come candidata M7. Successivamente alla selezione M5, ESA mi ha nominato Lead Scientist, riconoscendomi al tempo stesso il ruolo di PI (Principal Investigator) del consorzio internazionale costituito dalle principali istituzioni e agenzie spaziali di numerosi paesi europei che ha sviluppato e proposto il concetto di missione.

La missione THESEUS ambisce a sfruttare i GRB per lo studio dell'Universo primordiale (prime stelle e galassie, processo di reionizzazione cosmica, *dark energy*) e al tempo stesso fornire un contributo fondamentale alla neonata astrofisica *multi-messenger* (in particolare legata allo studio della sorgenti di onde gravitazionali) e *time-domain*, in grandissimo sviluppo. La collaborazione THESEUS include scienziati e tecnologi di numerosi paesi europei e riscuote un forte interesse anche da parte di scienziati e tecnologi di USA, Cina, Giappone e altri paesi non europei. A livello scientifico, il consorzio include ora più di 500 scienziati europei ed extra-europei. La proposta THESEUS ha ricevuto lettere di esplicito commitment al supporto dell'assessment study (e successive fasi di sviluppo), o di interesse a un supporto attivo, da parte delle agenzie / enti di riferimento spaziali di Italia (ASI), UK (UKSA), Spagna (SNP&D&I e CRISA), Danimarca (DTU Space), Polonia (Space Research Center, Polish Academy of Sciences e Ministero dell'Economia, Dipartimento Innovazione e Industria), Repubblica Ceca (Czech Technical University), Slovenia (Space-SI), Francia (CNES), USA (NASA), Ungheria (Ministry of National Development e Hungarian Academy of Sciences).

La Scoperta di una 'edge' transiente nello spettro X e misura del redshift di GRB990705

Questa scoperta, pubblicata sulla rivista Science (Amati et al., 2000, Science, Vol. 981, Pag. 290, 953), è senza precedenti ed è stata permessa dalla notevole accuratezza e calibrazione delle WFC rispetto a strumenti di questo tipo volati sia in precedenza che successivamente. Sono notevoli le implicazioni sull'ambiente *circum-burst* (e quindi la comprensione della natura progenitore). Inoltre, interpretando la 'feature' di assorbimento come un' edge del ferro neutro, è stata possibile la **prima e unica stima del redshift di un GRB basata su misure X**. Tale stima è stata poi confermata dalle misure di spettroscopia ottica della galassia ospite, dimostrando la fattibilità della misura del redshift dei GRB in raggi X e costituendo un importante elemento di caso scientifico per gli esperimenti sui GRB di prossima generazione.

Il contributo all'astrofisica multi-messenger tramite la partecipazione a GRAWITA ed ENGRAVE

Sono membro, fin dalla loro istituzione, delle collaborazioni GRAWITA ed ENGRAVE, la prima a livello INAF e la seconda a livello Europeo, dedicate alla ricerca di controparti elettromagnetiche dei segnali di onde gravitazionali rilevati da LIGO, Virgo ed i futuri rivelatori (KAGRA in primis). In questo contesto, sono co-autore del lavoro che ha pubblicato le osservazioni "multi-wavelength" della prima sorgente di onde gravitazionali dalla fusione di due stelle di neutroni (GW170917), misure che hanno sancito la nascita dell'astrofisica *multi-messenger*. L'articolo Abbott et al., ApJ, 2017, del quale sono co-autore e che riporta questi risultati, ha già più di mille citazioni.
